

Directions: Use this space to provide a quick insight on the reflection questions and short summary of your learning from the canvas materials (Week 5 & 6).

Student Name	
Cohort	
Topic 1:	Problem statement/Definition
Reflection questions: 1. From the reading, what stood out to you the most about how to identify and define a problem?	What stood out to me the most is that defining a problem requires looking beyond the obvious symptoms and understanding the root causes. A problem can seem to be straightforward at first, but without analyzing the context and its root causes, there is a chance of making solutions that do not cover the real problem. Also, a good defined problem focuses on the actual need rather than going immediately to a solution. So, we must understand what is happening, reason and real approach to tackle it.
Reflection questions: 2. In your own words, how would you explain the difference between: • Situation Analysis • Problem Analysis • Gap Analysis	In short, the Situation Analysis helps us understand the context and the overall environment in which a problem exists, the Problem Analysis helps us identify the causes and factors contributing to it, and the Gap Analysis helps us determine what needs to change to achieve the desired outcome.
What questions do you still have after reviewing the resources on the problem statement ?	After reviewing the resources, I still wonder how to know if a problem is specific enough to become a strong problem statement. I also have questions about how much research or evidence is needed before defining a problem.
Topic 2:	Futures Thinking

Reflection questions: 1. In your own words, how would you explain Futures Thinking to a friend? 2. Which Futures Thinking practice (signal scanning, scenario planning, foresight) seems most useful to you, and why?	I would explain it to a friend as a way of preparing for the future by considering different possibilities instead of trying to predict exactly what will happen. The Futures Thinking practice that seems most useful to me is scenario planning because it helps me think about different possible outcomes instead of assuming there is only one future
<i>What is something that remains unclear to you from the materials?/ After going through the resources, what would you like to explore or understand better?</i>	After going through the resources, I understand the basic ideas behind Futures Thinking, but I would like to learn more about how it is actually used in real life. The concepts of signal scanning, foresight, and scenario planning make sense in theory, but I think seeing examples from experts who use these methods would help me understand them better. I would also like to know how professionals decide which future trends and signals are important enough to pay attention to.
